

Secure Payment with Gasboy

▶ **Gasboy's Islander PRIME is now available for EMV payment.**

The Gasboy Islander™ PRIME is the best-in-class homebase controller. It is an all-in-one standalone pedestal that enables forecourt automation with flexible fueling authorizations.

When equipped with the EMV option, the Islander™ PRIME becomes a secure standalone payment terminal that does not require an additional POS (Point-of-Sale) system. The Islander PRIME EMV's hybrid card reader allows retailers to securely manage payment transactions with both magnetic and chip cards.

Gasboy's Islander PRIME EMV is perfect for unattended retail fueling applications like cardlocks, co-ops, airports, and marinas.

▶ **Why EMV?**

Developed by the major card brands, EMV is a globally recognized security standard for credit card transactions. The standard requires EMV approved card readers that read the chip on credit cards rather than the magnetic stripe.

In April 2021, liability for fraud at retail fueling locations shifted from the card providers to the retailers.

When upgrading to EMV standards, both retailers and consumers are protected. The Islander PRIME EMV protects retailers from the risk of chargebacks as a result of fraudulent transactions. Additionally, the Islander PRIME EMV solution provides consumers with the assurance that their valuable credit card information is protected.
